

# Leveraging Real-Time ADT Insights to Improve Quality of Care

“We use Lightbeam to help us get the insights needed to deliver quality care management.”

Tobe Fisch, MD, PhD, MMM

**Lightbeam's Admission, Discharge, and Transfer (ADT) Insights Module** helps care teams proactively intervene in cases where hospitalization can be avoided. Leveraging real-time notifications, ADT insights enables providers to stay informed across their entire practice leading to improved ED utilization, decreased readmission rates, improved medication adherence, and ultimately a better quality of life for the patient.

When an ADT event occurs, Lightbeam sends a timely notification to the assigned provider or care team. Once assigned, the care team can identify and prioritize which notifications should be managed first by comparing Lightbeam's ability to impact (ATI) score against the John's Hopkins ACG risk score.

Additionally, ADT Insights ensures patients are assigned to the appropriate post-discharge workflow. Users can see which patients have been admitted or discharged within the past day, week, or month, and promptly intervene for patient outreach, post-discharge medication review, transitional care management or follow up scheduling. Leveraging ADT Insights, one Lightbeam client was able to achieve a 14% reduction in readmissions representing savings more than \$4.3 million.

## Receive Real-Time Notifications

Receive actionable information from timely notifications sent within 15 minutes of an event

## Reduce Burnout

Alleviate administrative burden by integrating with Lightbeam's care management workflows

## Reduce Readmissions

Reduce readmissions by identifying ideal candidates for post-discharge care

## Identify Gaps In Care

Mitigate overutilization by identifying patients who have gaps in care

## TCM Programs

Create a strong foundation for TCM programs
